## *Healthy House Training for Professionals*

With an estimated 36 million Americans suffering from allergies or asthma, indoor air quality concerns is the number one environmental health concern for America's families. In Washington state, the asthma epidemic has reached epic proportions with over 1 in 6 families affected.

The Environmental Protection Agency indicates that indoor air pollutants may be 100 times higher than outdoor levels, and people are spending more and more of their time indoors.

### **What can you do?**

The American Lung Association of Washington is proud to offer this training course for builders, renovators, architects and homeowners on techniques to improve the indoor air quality of homes that they build or renovate.

## **THE TRAINING**

This fall, the ALAW is offering a select number of businesses the opportunity to discover the state of the art techniques in improving IAQ.

Learn cost-effective, healthy choices in construction techniques and take a site visit to a model home.

Participants receive 7 weeks of expert instruction from a variety of industry leaders. This course is modeled after the Nationally recognized Minnesota Health House training and offers Washington Builders a unique opportunity to respond to public demand for green buildings.
